

## MAX3798 Evaluation Kit

### General Description

The MAX3798 evaluation kit (EV kit) is an assembled electrical demonstration board that provides easy computer-controlled evaluation of the MAX3798 multirate limiting amplifier and VCSEL driver. The included software communicates with the EV kit through the USB port and provides access to all the internal registers to optimize the MAX3798 functionality. A +3.3V supply and USB port powers the EV kit. SMA connectors are used for the high-speed inputs and outputs. An LED indicates the status of USB power.

### Features

- ◆ Fully Assembled and Tested
- ◆ Software Control Through USB Port
- ◆ SMA Connectors for High-Speed Inputs and Outputs
- ◆ Powered by +3.3V Supply and USB Port
- ◆ Indicator for USB Power

### Quick Start

**Note:** In the following section, software-related items are identified by bolding. Text in **bold** refers to items directly from the EV kit software. Text in **bold and underlined** refers to items from the Windows® operating system.

- 1) Install shunts on jumpers JU1 to JU7.
- 2) Connect a +3.3V supply to VCC (J13) and GND (J10). Set the supply current limit to 300mA.
- 3) Connect the computer to the EV kit with a USB cable (A-Male to Mini-B-Male). LED D6 should switch on, indicating that USB power is detected.
- 4) Connect a 2.0V power source to BIAS (TP3) to ensure proper transmitter operation.
- 5) To download the latest version of the EV kit software (MAX3798revX.zip), visit the Maxim website at [www.maxim-ic.com/evkitsoftware](http://www.maxim-ic.com/evkitsoftware). Uncompress the zip file to a local folder and run the installation file (setup.exe). Installation requires administrative rights and can also require Internet access to download necessary drivers.
- 6) After installation is complete, follow this path to start the program: **Start** → **All Programs** → **Maxim Integrated Products** → **MAX3798 Evaluation Kit**.
- 7) If the MAX3798 EV kit is connected with a USB cable, the **Status** indicator turns green. Otherwise, double-check the USB connection.
- 8) The receiver (Figure 1) and transmitter (Figure 2) are controlled on separate tabs. The registers contain a default setting and can be read using the **Read All** button. For detailed register functions, refer to the MAX3798 IC data sheet.
- 9) Connect a 50Ω CML source to RIN± (J4 and J9) for the receiver. Connect a 50Ω CML source to TIN± (J5 and J6). Set the input amplitude to 400mV<sub>p-p</sub>.
- 10) Connect a 50Ω terminated oscilloscope to ROUT± (J7 and J8) and to TOUT± (J1 and J2). The receiver output amplitude can be adjusted with the **CML output level** control. The transmitter output amplitude can be adjusted with the **IMod** control.
